Neuropsychological deficits after mild head injury in children. Twenty-three children with a history of mild head injury were studied by means of standardized testing 4 years after injury. Twenty-two were examined only once. The results were compared to a control group matched for age and sex, and factors influencing the outcome were studied. A greater proportion of the patients than of the controls had had an accident while motorized. A significant rate of cognitive deficits was found. These were most frequent in the tests measuring attentional abilities, memory, executive functions, and speed of processing. A larger proportion of patients than controls showed differences exceeding clinical significance. The influence of the various factors on the cognitive outcome was studied. They could not, however, satisfactorily account for the observed differences between patients and controls. This invention relates to a new approach to measuring the thickness of thin films. It has application in particular to determining the thickness of thin films deposited on glass substrates and other optical films in an optoelectronic device. The most common measuring techniques now used for the thickness of thin films are the optical interferometer method and the contact radiometer method. Both are relatively slow, particularly for thin film thicknesses. Optical interferometer methods measure the reflectivity of the film and so are used to determine the thin film thickness when the film is an intrinsically reflective film. They are most common when used for measuring the thickness of thin oxide films. A major problem with these methods is that errors can occur from the uneven reflectivity of rough surfaces. Contact radiometer methods typically use a penetrating probe to sense the reflectivity of the film and thus to determine the film thickness. They can sense the film thickness to within 0.1 nm and are used for measurement of films thicker than about 100 nm. However, in both of these methods it is important that the film be very clean and smooth so that the reflectivity is not disturbed by the presence of even minor scratches on the surface. There are two main categories of reflectivity techniques, both of which are used for measuring the thickness of thin films: (1) the Brewster Angle Moire method (BAM) and the Modulation Moire method (MMM) and (2) the technique of coating the film with metal and measuring the voltage across a capacitor of the material of the film and the metal. Both these techniques have similar problems in obtaining accurate results: they rely on measurements of small signals and are sensitive to changes of critical angles of refraction.Q

Q: How to Find Local Properties in Members of Object-Related Code I've been working with Classes in VB6 for a while, but haven't used them in a while, and I'm rusty. What I'm trying to do is learn how to effectively search through class members and look for a property of an object. I could use some help in an example. Lets say I have the following class: Public Class MyClass Public Property _MyProperty As Boolean Private Function GetProperty() As Boolean GetProperty = _MyProperty End Function End Class And I have an object defined as follows: Dim obj1 As New MyClass I want to find the member of the class that obj1.GetProperty() returns. So, if I have Dim obj1 As New MyClass Dim obj2 As New MyClass obj1.GetProperty() = False obj2.GetProperty() = True How can I find obj2's member _MyProperty, given that I know obj1 is of type MyClass? I tried doing this: For Each p In Reflection.GetMembers(Of MyClass)(obj1) 'Do something... Next But, it looks like VB6 doesn't allow this. Any ideas? A: You're probably looking for p.Name: for each p in Reflection.GetMembers(Of MyClass)(obj1) if p.Name = "_MyProperty" then // do something end if next The diagnostic value of abdominal CT scanning in acute pancreatitis. Thirty-four patients were treated for a suspected acute pancreatitis at the University Hospital in Malmö, Sweden, and the hospital records and abdominal CT scans were reviewed. Based on routine follow-up, patients were then classified into two groups, i.e., correct diagnosed and misdiagnosed. Patients with correct diagnosed acute pancreatitis showed a significantly longer duration of symptoms and significantly increased serum levels of amylase and lipase compared with the patients misdiagnosed. The abdominal CT scan showed pathological changes in 72% of the correct diagnosed patients and in none of the misdiagnosed patients. All these changes were comparable with the findings of abdominal ultrasound
