AutoCAD AutoCAD is a commercial computer-aided design (CAD) and drafting software application developed by Autodesk. The application first appeared in December 1982 as a desktop app running on microcomputers with internal graphics controllers, and was the first widely available commercial desktop-appled drawing program. Before AutoCAD, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal, and most such programs were proprietary, requiring a considerable investment to obtain and use. AutoCAD is also available as mobile and web apps, and the application is used in a variety of other business and technical fields, including architectural design, construction, and engineering. AutoCAD's easy-to-learn, intuitive, and highly graphical user interface makes it a popular desktop application among business users. AutoCAD also offers a variety of drawing-related and editing tools, which can be configured to produce the desired look of drawings. Although AutoCAD lacks a specific design-review application, it is possible to use another application to create and import models that will be used in subsequent AutoCAD drawings. History AutoCAD was the first widely available commercial desktop-appled drawing program and led to the emergence of similar software packages that appeared on many of the same platforms, including postscript, Adobe PageMaker, and Dymo's QuickDesign. From its inception, AutoCAD has been recognized for its ease of use, lack of steep learning curve, and wealth of features. AutoCAD is derived from a series of basic applications called Digitizing, Dimensioning, Designing, and Editing, collectively known as DDE, which were developed from 1972 to 1974 to support such tasks as cadastral drafting and financial analysis at the Massachusetts

In November 2018, Autodesk announced a new Visual LISP programming language that is intended to simplify the process of extending the AutoCAD engine. Visual LISP is cross-platform, and thus should be available on most operating systems, including Mac OS and Linux. In 2010, the best-selling program Schematico was released with AutoCAD 2009 (which was based on AutoCAD 2009 Architectural, released in 2009). For example, in a project AutoCAD Plant, the user designs the architecture and interior of a building with specialized tools. The data is then automatically converted to a construction plan, thus allowing the building to be fully assembled with the help of a crane and other machine tools. Another example is AutoCAD PipeFitter. The user is able to design the pipe for a drain, using a plugin for the program, and the software generates a drawing for the pipe as a part of the overall building design. Most of the software products that are based on AutoCAD are created by a company called 3D Systems. The purpose of this study is to examine the relation between life satisfaction and individual differences in qualifying performance in sport. The sample consisted of 390 participants (260 women, 130 men) who, at the beginning of the study, were involved in the sport of basketball, football or handball. Each participant was observed two times with a 5-year interval between each observation. Results showed that life satisfaction was related to individual differences in sport performance, but that the relation was not linear. A clear positive relation between life satisfaction and qualified performance was found among men, but not among women. The interaction between sex and level of performance is discussed.Poonam Walia Poonam Walia is a social entrepreneur and the founder of India's first social franchise, Swachh Abhiyan. I have a test program that takes the same input as I want my script to do, and it runs fine. The problem is that my script throws up a seg fault immediately after I get the input from stdin. The first line of my script is: my $i = read(STDIN, $_, length($_)); The test program looks like this: use Test::More; use StdClass; my $i = read(STDIN, $_, length($_)); # Check to see if its an integer. my $num = ref $i; my $int_val = $i == $int; # Check to see if its a string my $str = ref $i; my $str_val = $i == $str; This code works fine. Now, in my script
