Eosinophil degranulation markers, eosinophil cationic protein (ECP) and eosinophil peroxidase (EPO) were determined in the serum of 40 asthmatic patients. All the patients had increased levels of ECP and EPO. The levels of these proteins increased with increasing severity

of the disease. No correlation was observed between the levels of ECP and EPO. The levels of ECP and EPO increased and decreased, respectively, in the patients with acute or atopic exacerbations. The levels of these proteins showed no correlation with that of serum immunoglobulin E (IgE). In contrast to other eosinophil-activation a1d647c40b
